

Event trigger on Camera A triggers Event on Camera B - Linked Monitors ZoneMinder

Ok so again, I found the wording of the docs to be hard to understand, but once I got it I was like really.

Long Story short is monitors automatically show up as linked, but you need to click it and save to have it actually be Linked. To unlink cntrl+click and save.

Example: In this Configuration QCam will trigger an Event when FosCam triggers an Alarm.

```
FosCam = Camera A  
QCam = Camera B
```

```
Foscam has 0 Linked Monitors  
QCam has 1 Linked Monitor
```

Don't link on both ends or you get a loop!

How I configured it was if you link a monitor, but its not in modect mode and just in monitor, it won't trigger an alarm even when camera A has an alarm. What you want to do is delete all zones on the linked monitor, but leave it in modect mode.
