

# Install KodiPlexConnect on Kodi 17.6 Krypton

## Plugins:

```
YouTube = Trailers  
PlayRandom = Random Vidoes (Options, Enable Play One Random)
```

## Install:

- Install Repo to get updates in future
  - Download ZIP and install per usual, will need to allow "unknown sources"
- <https://github.com/croneter/PlexKodiConnect/wiki/Installation#installation-from-repository-recommended>

## Setup:

- If you have separate movie folders in Plex you need to customize shortcuts, different for each skin
- <https://github.com/croneter/PlexKodiConnect/wiki/Video-Nodes-and-Skins>

```
Settings - Skin Settings - Configure shortcuts - Edit menu shortcuts / Add (or Change) Shortcut  
Then pick the correct Plex library, e.g.  
Video Library - Movies (with a Plex icon) - Movies  
or sometimes also  
Video Library - Video Add-On - PlexKodiConnect - Movies
```

- I use Direct Paths w/ Custom SMB Replacements since my Plex Server is a VM which accesses the files over NFS on my main "FileServer" which also exports via SMB

In my exmapple I used the following:

Replace:

```
/srv/raid/
```

With:

```
smb::\\192.168.1.XYZ\Cloud\
```

Cloud being the name in smb conf inside the square brackets[] and the root of my FileServer
